What is a portable power station capacity?

A portable power station's capacity, which is measured in watt hours (Wh), determines how long a portable power station can provide power for a given total wattage of electronics or appliances before its batteries are depleted.

How many Watts should a power station run off?

Watt hours/watts=runtime. If you have a portable power station with a 2,400 Wh capacity, and the device you're planning to run off it totals 400 watts, then ideally you'd get six hours of power before draining the power station.

How much power does a 2400 watt power station use?

However, since some power is lost in connections and through the electricity the power station itself uses, you can only realistically expect to get around 85 percent of a power station's listed watt hour capacity. So, for a 2,400 Wh power station, you'll likely get around 2,040 of usable watt hours ($2,400 \times 0.85 = 2,040$ Wh).

What size power station do I Need?

The first step to deciding what size power station you need involves taking stock of those electronics and appliances you want to power with it. Start by making a list of devices you plan to use with your portable power station. At the top of your list should be any essential medical devices, such as a CPAP machine.

To give you a clearer picture, a 1,000-watt power station can supply power to a 1,000-watt device for one hour. If you're powering a 100-watt device, like a mini-fridge, the same 1,000Wh ...
