-----

In response to the coexistence of distributed power sources and loads in microgrids, wherein weather characteristics concurrently influence their power, a joint short-term power ...

Based on predicting load, the fixed-time consistency algorithm with random delay is used to add supply and demand balance constraints to optimize the power distribution of the power ...

To address these challenges, a fixed SPM-LSTM approach is proposed. SPM for discrete data and LSTM for continuous data. The proposed model uses past consumption, temperature, ...

The study not only provides a systematic framework for load prediction in microgrids but also highlights the economic benefits of effective peak load management.

In this paper, a load-forecasting algorithm for microgrid based on improved long short-term memory neural network (LSTM) is proposed. Firstly, the criticality analysis of load influencing ...

In this section, we discuss TSA estimating methods for estimating ...

The proposed SVR algorithm leverages comprehensive historical energy production data, detailed weather patterns, and dynamic grid conditions to accurately forecast power generation.

Efficient energy management and accurate load forecasting are one of the critical aspects for improving the operation of microgrids. Various approaches for energy prediction and load ...

In this section, we discuss TSA estimating methods for estimating RES, load, and power prices for the power system and the smart grid as well as the MG environment.

Predicting electrical load is crucial for microgrid energy management. Short-term load forecasting (STLF) helps in optimizing energy management and load balancing within microgrids.

This model is established on the MV-UIC-FA foundation for the joint ultra-short-term forecasting of source and load power in microgrids.
