We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest ...

At the link below you can find a detailed description of the structure of our data pipeline, including links to all the code used to prepare data across Our World in Data. The annual change in ...

Last year, the U.S. saw additions of about 45 GW of solar and wind combined. This increase from 2023 shows robust progress, but we still need more growth in carbon free generation ...

Solar power includes solar farms as well as local distributed generation, mostly on rooftops and increasingly from community solar arrays. In 2024, utility-scale solar power generated 219.8 terawatt ...

OverviewSolar photovoltaic powerSolar potentialHistoryConcentrated solar power (CSP)Government supportSee alsoFurther readingIn the United States, 14,626 MW of PV was installed in 2016, a 95% increase over 2015 (7,493 MW). During 2016, 22 states added at least 100 MW of capacity. Just 4,751 MW of PV installations were completed in 2013. The U.S. had approximately 440 MW of off-grid photovoltaics as of the end of 2010. Through the end of 2005, a majority of photovoltaics in the United States was off-grid.

The U.S. solar power industry installed 11.7 GW of new generation in the third quarter of this year, according to a report from Wood Mackenzie and the Solar Energy Industries Association ...

The rapid growth of solar power in recent years has been one of the most remarkable stories of global energy. In 2022, the world added more new solar capacity than all other energy ...

It examines the current state of solar power and related academic solar energy research in different countries, aiming to provide valuable guidance for researchers, designers, and policymakers ...

In 2024, generators added a record 30 GW of utility-scale solar to the U.S. grid, accounting for 61% of

Solar power generation in recent years

capacity additions last year. We expect this trend will continue in 2025, with 32.5 GW of new utility ...

In recent years, solar power generation has seen more rapid growth than wind power in the United States. However, among renewables used for electricity, wind has been a more common ...

Over the past five years, this sustained growth has shifted solar from a supplemental resource to a dominant source of new power generation, driven by falling technology costs, rising ...
