How do you test a faulty alternator?

The best way to test an alternator is with a multimeter, but if you don't have a multimeter handy, there are a couple other methods that you can try that will help you diagnose a faulty alternator. You can test an alternator by disconnecting the negative cable as described above, or you can use a screwdriver.

Can a multimeter test a battery terminal alternator?

While the disconnecting battery terminal alternator test only checks for undercharging, a multimeter test can check both undercharging and overcharging. If you can, it's recommended to use the multimeter test. Headlights and interior lights are dimmer than usual during this test.

Can you test an alternator by disconnecting a positive battery cable?

You should not test an alternator by disconnecting the positive battery cable due to a high risk of electrocution. If you do want to quickly test your car alternator, and you are confident that you won't damage any of your car's electrical systems, you should disconnect the negative battery cable from the car battery.

What does the disconnecting battery terminal alternator test check?

With the disconnecting battery terminal alternator test, you will only test undercharging. However, with a multimeter test that I will also explain, you can test both, so if you can, go with the multimeter test.
