Currently, solar, wind, and bioenergy technologies offer the most immediate opportunities for generating renewable energy in the ROW. Of these, solar energy has been implemented most to date.

The Ray used a tool developed by Esri to conduct geospatial analysis of Iowa's 238,000 acres of highway right of way to identify and rank potential sites for solar panels.

Solar roads improve energy efficiency by generating electricity at the point of consumption. This decentralized approach minimizes transmission losses associated with traditional centralized power ...

Federal Highway Administration (FHWA) Requirements for Renewable Energy Projects in Highway Right-of-Way (ROW): doing so. This quick guide is intended to point FHWA Division Offices and ...

By implementing solar along our highway system, we can create a nationwide network of clean energy production that reduces our reliance on imported fuels and centralized power systems, ...

A 2020 research report commissioned by Caltrans provides guidance for installing solar generation facilities in its right-of-way and analyzes best practices, which can help California take ...

Solar panels should face true south, not magnetic south. The difference between these directions, called magnetic declination, can vary by up to 30 degrees depending on your location.

Solar panels must be oriented to maximize exposure to sunlight. The ideal positioning can vary depending on various geographic and seasonal factors. For instance, in the Northern ...

Given the substantial energy consumption of highway infrastructure, integrating transportation and energy sectors is the way forward. Policymakers must prioritize research in these ...
