---

Total electricity demand is rising, but at a far more moderate 2.3 percent, and, depending on how the weather drives heating demand, that number could be even lower by the end of the year.

We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest ...

To study America's growing renewable electricity capacity and generation, Climate Central analyzed historical data on solar and wind energy over a 10-year period (2014 to 2023).

Between now and 2030, the world is on course to add more than 5 500 gigawatts of renewable power capacity - roughly equal the current power capacity of China, the European Union, ...

The US clean electricity transition continued as wind and solar generated more than coal for the first time. Electricity demand growth sped up and solar generation rose more quickly than gas ...

In our latest Short-Term Energy Outlook, we forecast that wind and solar energy will lead growth in U.S. power generation for the next two years.

Solar, wind, and batteries are set to supply virtually all net new US generating capacity in 2026, according to the latest EIA data.

Worldwide solar and wind power generation has outpaced electricity demand this year, and for the first time on record, renewable energies combined generated more power than coal,...

Solar and wind energy will lead the growth in U.S. power generation for at least the next two years, according

# Will photovoltaic and wind power generate a lot of electricity by the end of the year

to EIA estimates. This report uses data from the EIA to analyze solar and...

Wind and solar developers often bring their projects on line at the end of the calendar year. So, the new capacity tends to affect generation growth trends for the following year.
